Kitchenaid refrigerator kscs25inss00 ice maker not working

If you enjoy serving cold drinks and iced cocktails to your friends and family, having an ice maker already built in with your freezer could prove to be a good investment. Luckily, KitchenAid offers a line of freezers that offers this very convenient feature. However, just like any other appliance inside your kitchen, the ice maker may eventually break down. If this happens, do not be too hasty in calling a repairman. Follow these simple steps in troubleshooting the KitchenAid Freezer ice maker first before calling in a professional. If the freezer is plugged in but the ice maker is not functioning, check the on/off lever. The switch arm can be seen right above the ice bucket. There are instances when somebody dispenses too much ice, the ice cubes in the bucket pushes up the lever and it gets stuck in that position. If this happens, the ice maker is switched off automatically. Simply push on the lever one more time and listen if the motor will start running again. If the ice maker does not respond, proceed to the next step. Check if the water hose supplies the trays with enough water. The water supply that feeds the trays comes from an outlet or faucet near the freezer unit. Impurities in the water can buildup in this hose causing the line to get blocked. If not enough water reaches the trays, the ice maker will not be able to produce ice. If you suspect that this is the problem, try to inspect the water hose from one end to the other. If there are parts that are bent or pinched, the water will not be able to pass through. Replace the hose if it has signs of wear or is damaged or punctured. Smooth it out if it has kinks. Push the hose firmly into the slot if it is hooked up loosely. This should solve the water supply problem and help your ice maker function properly again. Pinch the ice maker's filling hose to check if it is frozen. The filling hose is the tube that supplies water to the individual ice trays. If the water inside this tube freezes, water will not flow into the trays and the ice maker will not have any ice to dispense. To check if this is the issue with your ice maker, squeeze the hose and see if it still bends. If it feels hard, switch off the freezer and ice maker and wrap the hose with a washcloth or towel dipped in very hot water. You can also use a hair dryer to thaw the ice stuck inside the tube. Avoid using too much heat as the filling hose could melt. Make certain that your freezer is set at 10 degrees Fahrenheit. Even though water freezes at 32 degrees Fahrenheit, the KitchenAid freezer ice maker requires that the temperature inside the system stay above 10 degrees in order for the ice cubes to freeze quickly. Your ice maker might encounter problems in dispensing ice as quickly as needed if the freezer temperature is higher than the prescribed setting. Lower the temperature setting and observe the performance of your ice maker for a few hours and see if the problem has been addressed. Once you have addressed any damage or defects in the ice maker, make sure that you maintain a clean and hygienic refrigerator to avoid contaminating the ice. If the ice starts to taste and smell funny, check the coating of the ice bucket. With frequent use, the interior coating of the ice bucket might erode and get mixed with the ice. This can affect the smell and taste of the ice being dispensed. If you see any peeling inside the bucket, go to the department store or any home improvement centers and purchase a brand new ice bucket. Photo Courtesy: Pixabay Ice cream is one of the most popular treats for a hot summer day. While you can head to the store and pick up a pint of your favorite flavor, it doesn't hold a candle to whipping up a batch of creamy goodness at home. Add any ingredients you like to make your blend or stick with a tried-and-true recipe. These top ice cream machines do the work for you so you can save your energy for other fun summer activities. MORE FROM CONSUMERSEARCH.COM If your KitchenAid Ice Maker is not working use this troubleshooting guide to diagnose common problems. Verify that the ice maker is turned on. If the ice maker's water supply is not connected to water supply line, turn the ice maker off. If the ice maker is on, but disconnected to water supply line, the following could happen: The ice maker will continue to try to make ice, causing a buzzing sound A refrigerator section may be too cold Food in crisper drawers may freeze First, ensure that ice is not jammed in the ejector arm of the ice maker. Remove jammed ice from the ejector arm using only a plastic utensil so the ice maker is not damaged. This will likely resolve the issue. Because the ice may not be completely frozen yet, when the harvest fingers try to harvest the ice cubes, the fingers bring up icy water that attaches to the stripper. This icy water can then freeze on the stripper during the next cycle causing an ice bridge. This ice bridge will cause the harvest fingers to jam. A clogged or incorrectly installed water filter will reduce the water flow to the ice maker and could cause thin, low or no ice production. CLICK HERE for additional information on checking the water filter. To purchase water filters, visit EveryDropWater.com. Their filter selection tool will help you identify the right filter for your refrigerator or icemaker. Flush the system is needed every time the filter is changed or once the refrigerator is installed to the water supply line for the first time. Air in the water system may cause dripping at the dispenser or small/hollow ice cubes. CLICK HERE for more information on how to flush the water system. Check the water supply line When checking the water supply line, ensure the water supply is properly connected to a cold water supply and the water shutoff valve is fully opened. Next, check to make sure there are no kinks in the water supply line. A kink in the line can reduce water flow. Straighten the water source line to restore adequate water flow and pressure. To help reduce the chances of a pinched water line, do not push the refrigerator too far back against the wall or cabinet. If you would like to download or view product literature for your appliance, please visit our Manuals and Literature page. Troubleshooting problems with an ice machine is often a task that you can handle on your own without calling in a professional. There are several common problems that affect ice machines regardless if you have a Manitowoc USA or Kenmore ice machine. Follow these steps for troubleshooting common problems.Ice Machine Doesn't Make IceOne of the biggest signs that your ice machine isn't working is that it has stopped making ice. First, check to make sure that the control arm is in the proper position. This arm pauses the ice machine when the bin is full, but it can get stuck or accidentally knocked out of position. If the control arm is fine, make sure that the water line isn't clogged or frozen. Next, check the filter to see that it is clean and free of debris. Consult your Manitowoc ice machine manual or the manual for the make and model you have for detailed instructions.Ice Machine Is FrozenAnother common problem with ice machines is that it gets frozen. It is making ice fine one day and, the next day, it's a solid block of ice. You'll have to defrost the ice machine completely to get it working again. Start by unplugging the refrigerator or ice machine if it is a standalone appliance. Remove all of the ice from the bin and place it in the sink. Use a hair dryer to defrost any ice buildup around the water intake hose and surrounding mechanism. Use towels to clean up the water as you go to reduce the risk of shock. Adjust the temperature on the thermostat to a higher level. Plug the machine back in.Ice Machine Leaks WaterA puddle on the floor around your ice machine is usually a sign that it's not sitting perfectly level. Use a level to make sure that it's not higher on one side than the other. Next, check the water supply line to make sure that it's not damaged or loose. Order a new part if it has a hole or crack in it. Lastly, check the fill cup to see if it's aligned correctly. Address any leaking issues immediately, even if it's just a small drip. Water on the floor can quickly cause damage to floors and walls.Ice Machine Won't Turn OffIf the ice machine won't turn off and continues to make ice even when the bin is full, then there's a problem with the control arm or bail wire. Start by removing it and cleaning it thoroughly, then reinstalling it. If the problem persists, replace the part completely.Ice Maker Doesn't Eject IceIf your Manitowoc ice machine or other model has a dispenser that isn't ejecting ice, there's a problem with the motor assembly. You'll need to order a replacement part and follow the instructions for your make and model for replacing it on your make and model ice machine. If the dispenser sounds like it's working but no ice comes out, then the dispenser itself may be clogged. Check to make sure nothing fell into the dispenser or that it's not blocked by a large block of ice. MORE FROM QUESTIONSANSWERED.NET
